

# random numbers in C++

Mr. Neat  
C++

# random

- generate a random number by calling the method random with an integer.

For example:

```
cout<< random(5);
```

will output a random number between 0 and 5 inclusive [0,5]

# random

- note the first line of the main method needs to be:

```
srand(time(NULL));
```

```
// this initializes the random number generator
```
